NAPA 6907 Air Filter Product Update

A recent update has taken place for the 6907 with a notable change in the sealing design.

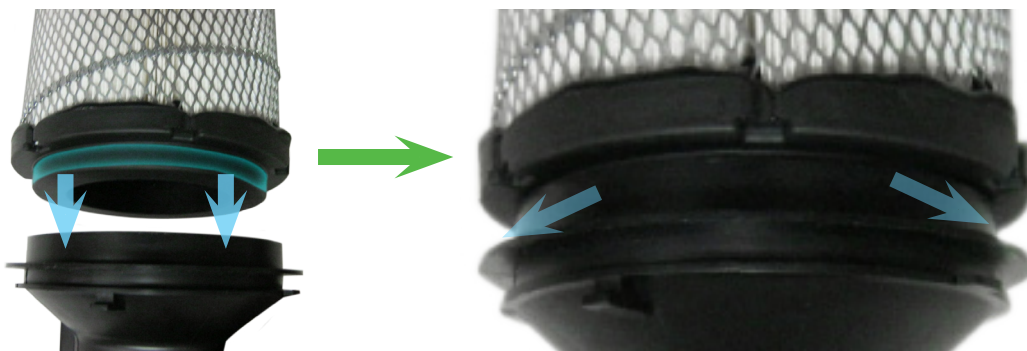

Previous 6907

The previous seal is similar to the original equipment service (OES) that seals over the outside of the flow tube.

Updated 6907

The updated design seals into the inside of the flow tube. The updated seal is more robust and easier to install/remove.

The update is part of an ongoing change. Principal applications included in this update are Chevrolet/GMC C4500 and C5500 trucks. It should be noted that both the previous and new 6907 are fully interchangeable and suitable for use on all recommended applications.
